Grouping objects

Collections and iterators

The requirement to group objects

- Many applications involve collections of objects:
 - Personal organizers.
 - Library catalogs.
 - Student-record system.
- The number of items to be stored varies.
 - Items added.
 - Items deleted.

Fixed-size collections

- Sometimes the maximum collection size can be pre-determined.
- Programming languages usually offer a special fixed-size collection type: an array.
- Java arrays can store objects or primitive-type values.
- Arrays use a special syntax.

Fixed-size collections

Examples:

int[] numbers;

String[] stories;

Point[] coordinates;

Circle[] balls;

Fixed-size collections

```
Examples:
int[] myIntArray = new int[3];
int[] myIntArray = {1,2,3};
int[] myIntArray = new int[]{1,2,3};
String[] myStringArray = new String[3];
String[] myStringArray = {"a", "b", "c"};
String[] myStringArray = new String[]{"a","b","c"};
String[] myStringArray;
myStringArray = new String[]{"a","b","c"};
```

The weblog-analyzer project

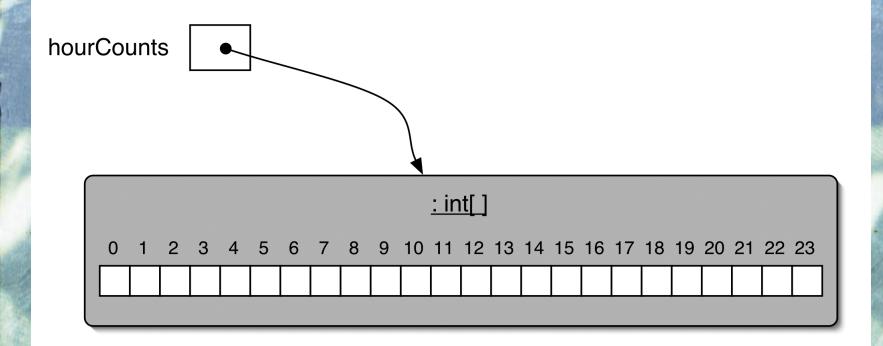

- Web server records details of each access.
- Supports webmaster's tasks.
 - Most popular pages.
 - Busiest periods.
 - How much data is being delivered.
 - Broken references.
- Analyze accesses by hour.

The weblog-analyzer project

- Apache access log
 - 192.168.2.20 - [28/Jul/2019:10:27:10 -0300]"GET /cgi-bin/try/ HTTP/1.0" 200 3395
 - 127.0.0.1 - [28/Jul/2019:10:27:32 -0300] "GET /hidden/ HTTP/1.0" 404 7218

Creating an array object

The hourCounts array

Using an array

- Square-bracket notation is used to access an array element: hourcounts[...]
- Elements are used like ordinary variables.
 - On the left of an assignment:
 - hourCounts[hour] = ...;
 - In an expression:
 - adjusted = hourCounts[hour] 3;
 - hourCounts[hour]++;

Variable-size collections

 But sometimes the maximum collection size cannot be determined!

Java has us covered here as well

A personal notebook

- Notes may be stored.
- Individual notes can be viewed.
- There is no limit to the number of notes.
- It will tell how many notes are stored.
- Explore the notebook1 project.

Class libraries

- Collections of useful classes.
- We don't have to write everything from scratch.
- Java calls its libraries, packages.
- Grouping objects is a recurring requirement.
 - The java.util package contains classes for doing this.

```
import java.util.ArrayList;
public class Notebook {
    // Storage for an arbitrary number of notes.
    private ArrayList<String> notes;
     * Perform any initialization required for the
     * notebook.
    public Notebook() {
        notes = new ArrayList<String>();
    }
```

Collections

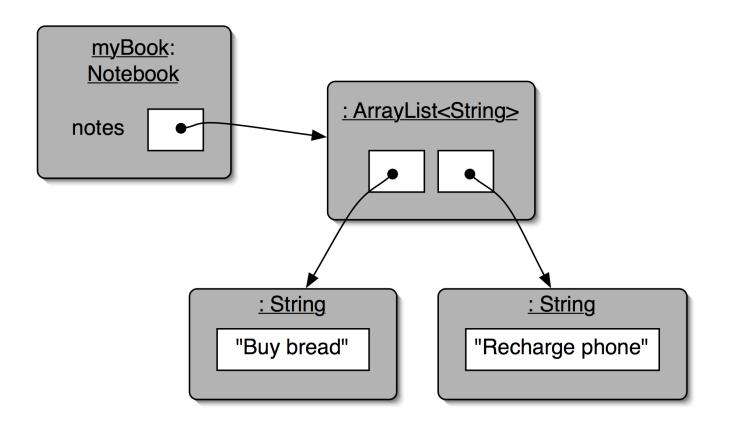

ArrayList<String> notes;

- We specify:
 - the type of collection: ArrayList
 - the type of objects it will contain: <String>
- We say, "ArrayList of String".

Generic classes

- Collections are known as parameterized or generic types.
- The type parameter says what we want a list of:
 - ArrayList<Person>
 - ArrayList<TicketMachine>
 - etc.
- ArrayList implements list functionality:
 - add, get, size, etc.

Object structures with collections

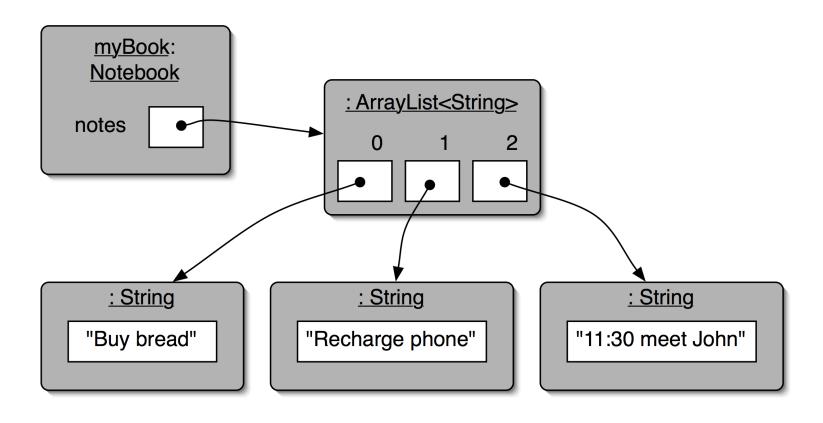

Features of the collection

- It increases its capacity as necessary.
- It keeps a private count (size() accessor).
- ArrayList keeps the objects in order.
- Details of how all this is done are hidden.
 - Does that matter? Does not knowing how prevent us from using it?

Using the collection

```
public class Notebook {
    private ArrayList<String> notes;
    public void storeNote(String note) {
        notes.add(note);
                                           Adding a new note
    public int numberOfNotes() {
        return notes.size();
                                    Returning the number of notes
                                            (delegation)
```

Adding a third note + Index numbering

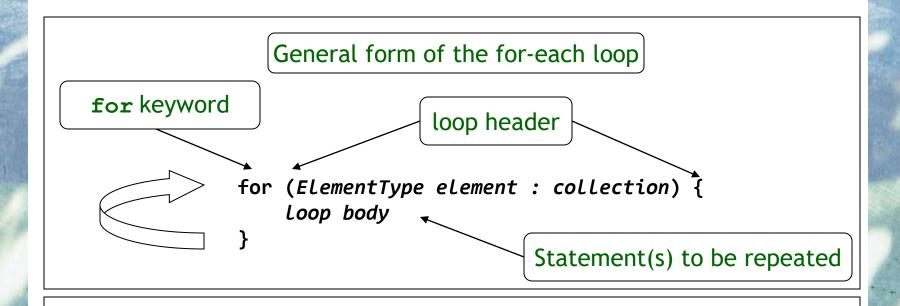

Retrieving an object

```
Index validity checks
public void showNote(int noteNumber)
    if(noteNumber < 0) {</pre>
        // This is not a valid note number.
    else if(noteNumber < numberOfNotes()) {</pre>
        System.out.println(notes.get(noteNumber));
    else {
        // This is not a valid note number.
                                     Retrieve and print the note
```

Iteration

- We often want to perform some actions an arbitrary number of times.
 - E.g., print all the notes in the notebook. How many are there?
- Most programming languages include loop statements to make this possible.
- Java has several sorts of loop statement.
 - One is for-each loop.

For-each loop pseudo code

Pseudo-code expression of the actions of a for-each loop

For each element in collection, do the things in the loop body.

A Java example

```
/**
  * List all notes in the notebook.
  */
public void listNotes() {
    for (String note : notes) {
        System.out.println(note);
    }
}
```

for each *note* in *notes*, print out *note*

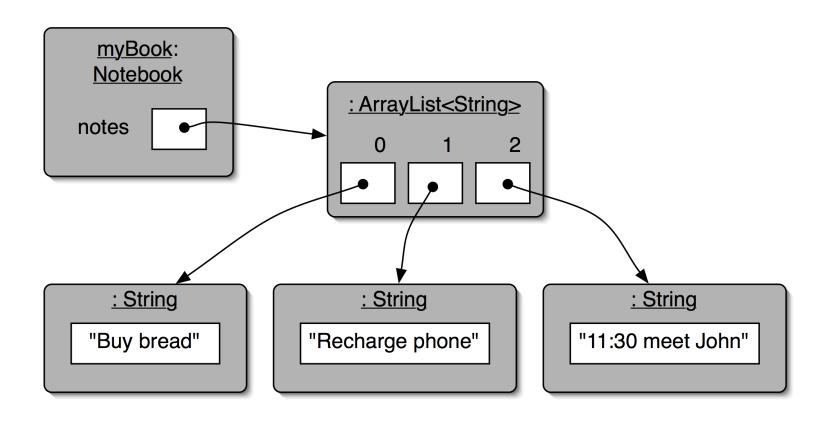

for-each versus while

- for-each:
 - easier to write.
 - safer: it is guaranteed to stop.
- while:
 - we don't *have* to process the whole collection.
 - doesn't even have to be used with a collection.
 - take care: could be an *infinite loop*.

Searching a collection

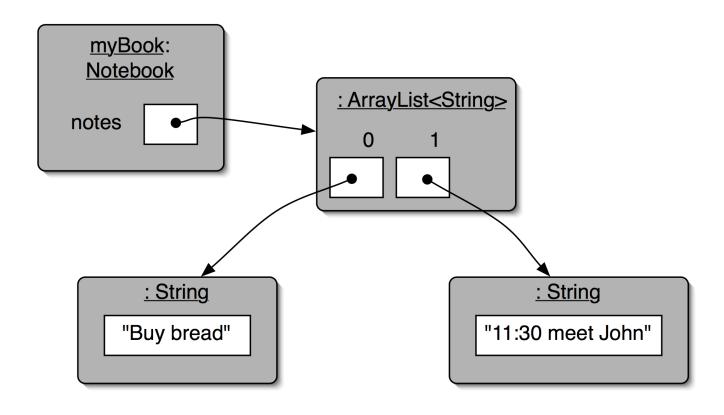

```
int index = 0;
boolean found = false;
while (index < notes.size()) {</pre>
    String note = notes.get(index);
    if (note.contains(searchString)) {
        found = true;
        // We don't need to keep looking.
        break;
    else {
        index++;
// Either we found it, or we searched the whole
// collection.
```

Index numbering

Removal may affect numbering

notes.remove(1);

Iteration fundamentals

- We often want to repeat some actions over and over.
- Loops provide us with a way to control how many times we repeat those actions.
- With collections, we often want to repeat things once for every object in a particular collection.

Using an Iterator object

```
public void listNotes() {
    Iterator<String> it = notes.iterator();
    while (it.hasNext()) {
        System.out.println(it.next());
    }
}
```

Using an Iterator object

```
for (String note : notes) {
    System.out.println(note);
    if(note.contains("Second")) {
        notes.remove("Second object.");
    }
}
```

```
Iterator<String> it = notes.iterator();
while (it.hasNext()) {
    String note = it.next();
    if (note.contains("Second")) {
        it.remove();
    }
}
```

Index versus Iterator

- Ways to iterate over a collection:
 - for-each loop.
 - Use if we want to process every element.
 - while loop.
 - Use if we might want to stop part way through.
 - Use for repetition that doesn't involve a collection.
 - Iterator object.
 - Use if we might want to stop part way through.
 - Often used with collections where indexed access is not very efficient, or impossible.
 - Can be used to remove objects from collection while iterating.

Review

- Arrays are appropriate where a fixedsize collection is required.
- Arrays use special syntax.
- For loops offer an alternative to while loops when the number of repetitions is known.
- For loops are used when an index variable is required.

Review

- Collections allow an arbitrary number of objects to be stored.
- Class libraries usually contain triedand-tested collection classes.
- Java's class libraries are called packages.
- We have used the ArrayList class from the java.util package.

ArrayList Review

- Items may be added and removed.
- Each item has an index.
- Index values may change if items are removed (or further items added).
- The main ArrayList methods are add, get, remove and size.
- ArrayList is a parameterized or generic type.
